

## Strategy Evaluation Checklist

| Criterion                                                | Status | Notes                                                                                                                                                                                                                                                |
|----------------------------------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Believable Core Logic</b>                             | ●      | Systematic pre-match statistical breakdown of a real WTA matchup ( <i>Sloane Stephens vs. Darja Vidmanova</i> in Memphis) using OnCourt database metrics (surface splits, hold/break rates, 1st/2nd serve percentages, and recent round statistics). |
| <b>Sustainable Market Principles</b>                     | ●      | Emphasizes situational context: weights Sloane Stephens' documented physical injury history (foot surgery rehab), analyzes second-serve vulnerability, and checks the quality of recent round opponents.                                             |
| <b>Mathematically Likely to Succeed</b>                  | ●      | Rejects backing the favorite pre-match at low odds (\$1.60\$); insists on an asymmetric value entry trigger in-running (\$2.10–2.30\$) with early liability elimination at \$1.70\$.                                                                 |
| <b>Robustness Against Commercial Hype / Scams</b>        | ●      | Zero get-rich-quick claims, no AI trading bot buzzwords, and no predatory sales funnels. Transparent, low-key analytical walkthrough.                                                                                                                |
| <b>Sound Risk Management &amp; Conditional Execution</b> | ●      | Strict entry price floor: requires market drift to establish positive expected value (+EV) and defines an explicit liability removal point (\$1.70\$).                                                                                               |

|                                        |                                                                                   |                                                                                                                                  |
|----------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>Practical Relevance for Traders</b> |  | Demonstrates a practical, grounded research routine for retail exchange traders seeking to exploit in-play WTA price volatility. |
|----------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|

## BS Factor Rating: 84 / 100

(100 = Sound, mathematically robust, and achievable; 0 = Totally unbelievable, unsustainable, and guaranteed to fail)

## Summary & Score Justification

This video by **TradeShark Betfair Tennis Trading** (*Free Trading Tip - Stephens v Vidmanova in WTA Memphis*) scores **84/100**. It provides a **credible, realistic, and mathematically disciplined approach to tennis exchange trading** without the deceptive marketing common in retail trading channels.

### Key Breakdown:

#### 1. Context-Driven Quantitative Analysis:

- Uses structured OnCourt database statistics (12-month hardcourt baseline splits and 2026 season data).
- Contextualizes the raw figures by examining the match stats of each player's previous round (break points faced, double fault counts, serve hold quality).
- Incorporates external domain knowledge—specifically Sloane Stephens' chronic foot injury and altered rehab path—to explain why her statistical output remains volatile.

#### 2. Disciplined Value-Seeking Entry Model:

- Rather than placing a negative-EV pre-match bet on Vidmanova at \$1.60\$, the trader establishes a conditional in-play trading plan:
  - **Entry Window:** Back Vidmanova only if early resistance or a break of serve drifts her odds into the **\$2.10–2.30\$** range.
  - **Risk Mitigation:** Remove liability at **\$1.70\$** upon a recovery, locking in upside on the statistical favorite.
  - **Execution Rule:** If the match fails to drift into the target price window, no trade is forced.

#### 3. Absence of Hype:

- The presenter openly states he may not even trade the match live due to the midnight scheduling, maintaining an honest, educational tone rather than pushing a product or claiming guaranteed profits.

#### 4. Areas Lacking Full Quantitative Rigor (Why it is 84, not 95+):

- **Staking Sizing Rules:** While the entry/exit odds are well-defined, the video does not specify exact fractional Kelly staking rules or strict bankroll stop-loss limits in the event of an unhedged blowout.
